

Khaiati.com

Detailed design of the requirements of the tailoring and fabric store management system

1.

General purpose of the system

The purpose of this system is to manage all tailoring activities, customer registration and management, garment sizes, designs, garment sewing process, assignment of work to workers, wages and salaries of workers, purchase and sale of fabrics, company accounts, debt and credit management, income, expenses, profit and loss in a systematic and comprehensive system database.

The system should be designed in such a way that all information about the customer, worker, fabric, clothing, sizes, financial transactions and reports can be easily recorded, searched, modified and reported

.

2.

Customer registration and management section

When a new customer visits the tailoring shop, his information should first be recorded in the system.

Customer Information:

.1 Customer ID

.2 Customer Name

.3 Phone Number

.4 Note

If the customer is already registered, then there is no need to register again; the system should be able to find and select the customer based on the following information:

Customer ID

.Name

.Phone Number

.After selecting the customer, his previous information and all his previous orders should also be displayed.

.3. Garment Order and Size Section

Once the customer is selected, we should be able to select the type of garment required for him.

The following five main types will be available in the system:

.1 Shirt / Dress

.2 Vest

.3 Coat

4 Pants

.5 Jackets

.For each type of garment, specific size, design, quantity, price and financial information should be recorded.

.4 Shirt/Clothing Size

.For shirts or garments, the following measurements should be recorded:

.1 Height

.2 Sleeve

.3 Shoulder

.4 Neck

.5 Armhole

.6 Chest

.7 Waist

.8 Hip

.9 Inseam

.10 Sleeve

.Design Management

.Different designs should be available for shirts. The customer can select his/her favorite design from the available designs.

.The system should also allow:

.New designs to be added.

.Existing designs to be modified.

.Designs to be deleted or deactivated.

.Name, image/sample and description should be recorded for each design.

.A specific design should be selected when the customer places an order.

.5 Vest Size

The following measurements are recorded for the vest:

.1 Height

.2 Shoulder

.3 Neck

.4 Armpit

.5 Waist

.6 Hip

.It should also be possible to record, select and add new designs for the vest.

6. Coat Size

.The following measurements are recorded for the kurti:

- .1 Height
- .2 Sleeve
- .3 Shoulder
- .4 Neck
- .5 Armpit
- .6 Hip
- .7 Hip
- .8 Waist
- .9 Chest
- .10 Note

.Different designs should also be recorded for the kurti and selected according to the customer's preference.

7. Trouser Size

.The following information is recorded for the trousers:

- .1 Height
- 2 Armpit
- .3 Waist
- .4 Hip
- .5 Hips
- .6 Waist
- .7 Note

It should also be possible to record and select different designs for trousers.

8. Size of the shirt

The following sizes are recorded for the shirt:

- .1 Height
- .2 Sleeve
- .3 Shoulder
- .4 Neck
- .5 Armpit
- .6 Chest
- .7 Waist
- .8 Hip
- .9 Note

Different designs should be recorded for the shirt and selected according to the customer's preference.

9. Section of the number of clothes and financial information

The following information should also be recorded for each dress or order:

- .1 Number of pairs
- .2 Price per pair
- .3 Total price

4 Prepaid Amount

.5 Remaining Amount / Balance

.6 Order Date

.7 Due Date

.8 Note

The system should automatically calculate the total price:

Total Price = Quantity × Price per Pair

And:

Balance = Total Price – Paid Amount

10. Order Workflow

Once the customer's measurements are taken and the number, design, and price of garments are specified, the order should be entered into the production or sewing process.

The system should assign a unique serial number to each order, so that later the customer, garment,

size, worker, and financial information can be found and tracked through this number.

The order statuses can be, for example:

New Order

Measurements Taken

Submitted to Scissors

Submitted to Sewing

In the Process

Completed

Delivered to Customer

Canceled

11. Worker Information Section

All workers should be registered in the system

Worker Information:

.1 Serial Number

.2 Name

.3 Occupation

.4 Contact Number

.5 Number / Employee Number

.6 Salary

.7 Note

The Workers section should have a search option so that workers can be found based on the following information:

Serial Number

Name

Phone Number

Worker Number

12. Worker Assignment Section

When a job is assigned to a worker, the worker must first be selected.

Then the unique serial number of the customer's order must be entered. The system should find the relevant customer and order through this serial number.

Then it should be specified which type of customer's item is assigned to the worker, such as:

Shirt / Dress

Vest

Kurti

Pants

Ice Cream

Also, the type of work must be specified, such as:

Scissors

Sewing

Correction

Other related tasks

The following information should be recorded when submitting work:

Worker

Customer

Order number

Garment type

Quantity

Type of work

Date of submission of work

Due date

Status of work

Wages

Notes

13. Workers' salary and wage system

There should be a separate financial system for workers, because the salary method of all workers is not the same.

The salary or wage period can be:

Weekly

Biweekly

Monthly

Wages based on each job

The system should maintain the entire salary history of each worker.

14. Worker's advance salary section

If a worker requests money before his scheduled salary date, the system should be able to record advance salary to him

The following information should be available for advance payment:

.1 Worker

.2 Advance payment amount

.3 Date

.4 Salary period

.5 Reason for advance

.6 Note

The system should keep this advance payment linked to the worker's future salary or account.

15. Worker's salary account and report

A complete financial report should be available for each worker by date.

The report should show:

Total salary paid

Labor wages

Advance payment

Amount paid

Remaining salary

Payment date

Salary period

All financial transactions

The system should be able to report on each worker for a specific date, week, month or a specific period.

16. Cloth store section

Another important part of the system is cloth management.

In this section, basic cloth information should first be recorded.

Cloth information

1 Fabric serial number

.2 Fabric name

.3 Fabric type

.4 Company/supplier

.5 Color

.6 Price per meter

.7 Selling price

.8 Available size

.9 Unit

.10 Note

.17. Fabric company and supplier information

.Companies and suppliers from whom fabrics are purchased must be recorded in the system.

.Company information:

.1 Serial number

.2 Company name

.3 Contact person

.4 Phone number

.5 Address

.6 Company number

.7 Note

.The system must be able to report all fabrics purchased from each company, total amount, amount paid, and remaining amount

.

.18. Fabric purchase section

.When fabric is purchased from a company or supplier, the following information must be recorded:

- .1 Serial number
- .2 Name of the fabric
- .3 Fabric company/supplier
- .4 Company name
- .5 Company bill number
- .6 Price per meter
- .7 Fabric size/meter
- .8 Total price
- .9 Fabric color
- .10 Sale price
- .11 Total sale price
- .12 Date of purchase
- .13 Amount paid
- .14 Remaining amount
- .15 Payment type
- .16 Note

The total price should be calculated automatically:

Purchase total = Price per meter × Fabric size

and for sale:

Sale total = Sale price × Fabric size

19. Fabric credit/loan system

Not all fabrics can be purchased in a fabric store with cash. Sometimes fabrics are purchased on credit, loan or by agreement with the company.

For this, a separate credit and loan system should be available in the system.

When a loan is taken or borrowed, the system must record the following information:

Company

Bill number

Total purchase amount

Amount paid

Amount outstanding

Loan date

Due date

Payment period

Payment date

Amount of each payment

Outstanding loan

Note

If the company is paid weekly or at a later date, each payment should be recorded separately.

20. Fabric sales system

When fabric is sold to a customer, a sales transaction should be recorded.

The following information should be included in the sales:

- .1 Sales serial number
- .2 Fabric
- .3 Color
- .4 Size/meter
- .5 Selling price per meter
- .6 Total price
- .7 Customer
- .8 Amount paid
- .9 Balance
- .10 Sale date
- .11 Note

After the sale of the fabric, the available amount should be automatically reduced

21. Stock / Management

The system should automatically manage the inventory of fabrics.

It should be known:

What fabric is available?

How many meters are available?

How much fabric has been purchased?

How much has been sold?

How much is left?

What is the purchase and sale price of each fabric?

What colors are available?

A history stock should also be available for each fabric.

22. Income and Expense System

The system should have a separate financial section for income and expenses.

Income:

Income from sewing clothes

Income from selling fabrics

Other income

Expenses:

Workers' salaries

Workers' wages

Advance salaries

Fabric purchase costs

Company payments

Shop expenses

Electricity

Rent

Transportation

Other expenses

23. Profit and loss report

The system should calculate the profit and loss of the business based on all financial information.

Reports should be available for the following periods:

Daily

Weekly

Monthly

Yearly

From a given date to a given date

The report should contain the following information:

Total income

Total expenses

Total purchases

Total sales

Salaries and wages of workers

Other expenses

Net profit / loss

24. Reporting section

The system should provide separate and comprehensive reports for different sections.

Customer report

All customers

New customers

Customer order history

All customer clothes

Paid money

Balance

Order report

All orders

Completed orders

Incomplete orders

Orders pending from due date

Search by customer and order number

Worker report

All workers

Work given to each worker

Completed work

Work pending

Wages

Salary

Advance

Paid money

Salary pending

Fabric report

Available fabric

Purchased fabric
Sold fabric
Stock remaining
Fabric company
Fabric color
Purchase and sale price
Financial Report
Total Revenue
Total Expenses
Total Debts
Total Payments
Total Outstanding
Profit
Loss

25. Search and Filter System

Search and Filter capabilities should be available in all important areas of the system.

Such as:

Customer Name
Customer Serial Number
Phone Number
Order Number
Worker Name
Worker Number
Worker Phone
Company Name
Bill Number
By Date

26. Backup and Restore System

The Backup Database and Restore capabilities should be available in the System Settings section.

Backup

The user should be able to take a complete backup of the database and store it in a designated location.

Restore

If the database is damaged or the data is deleted, the database should be restored from the previous backup.

There should also be an automatic backup option so that the system can automatically create a backup at a specified time.

27. User and Security System

The system should also have a Management User section.

For example:

Administrator

Manager

Accountant

Storekeeper

Employee

Each user should have access to the system according to their authority.

For example, an ordinary employee should not have permission to delete the database or make important financial adjustments.

28. Overall Conclusion of the System

This system database should connect all the important tasks of the tailoring and clothing store into a single and organized system.

The main components of the system will be:

.1 Customers

.2 Orders

.3 Clothing sizes

.4 Designs

.5 Workers

.6 Assignment of work to workers

7 Salary and wages

.8 Advance salary

.9 Fabrics

.10 Companies and suppliers

.11 Fabric purchase

.12 Fabric sales

.13 / Stock availability

.14 Loans and advances

.15 Revenue

.16 Expenses

.17 Profit and loss

.18 Reports

.Filter and Search

.19

User Management

.20

Database Backup

.21

Database Restore

.22

In this way, all operational and financial information of the tailoring business will be kept organized in a single database, a complete history of each customer and order will be available, the work assigned to the workers and their salaries will be accurately tracked, the fabric inventory and company accounts will be controlled, and finally, complete and accurate reports of business income, expenses, profit, loss and balances can be obtained
